

src\components\Modal.jsx

```
1  //
2  // MODAL
3  // =====
4  // This is a React component that is able to wrap one or more
5  // components and make them display modal. It illustrates how
6  // a component can make the components it wraps around operate
7  // with a special React characteristic called "children". This
8  // is a reserved property. It refers to all the content between
9  // the opening and the closing tags the component wraps around.
10 //
